//U-F-EC1 is a normalized CDNA library containing the following tissue(s): Normal lung from adult and from fetal day 64, day 87, week 19 and week 42. The library was constructed according to Bonaldo. Lennon and Soares, Genome Research, 6:791-806, 1996. First strand CDNA synthesis was primed with an oligo-dr primer containing a Not I site. Double stranded chonk was ligated to an ECOR adaptor, digested with Not I, and cloned directionally into pT773-Pac vector: The oligomucleotide used to prime the synthesis of first-strand CDNA contains a library tag sequence that is located between the Not I site and the Normanne of the synthesis was library is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1341
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1222 ATGCTCTGGGGCTTTCATGGGAATGATGATGATAATGAGAAAAATGTTATCATTATT 1281

Isolated polypeptide with a human membrane associated protein sequence is useful for the diagnosis, prevention and treatment of cell proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders.

Claim 1; Page 131-132; 173pp; English

AAF81741 to AAF81777 encode the human membrane associated proteins (MEMAP) given in AAB74695 to AAB74731. MEMAPS have cytostatic, antiinflammatory, anticonvilsant, immunosuppressive, antidiarrheic and antiarteriosclerotic activities, which can be used in gene therapy. MEMAPs and agonist of MEMAPs can be used to treat a disease or condition associated with decreased expression of functional MEMAP and antagonists

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
of MEMAP are used to treat a disease or condition associated with

coverexpression of functional MEMAP. These disorders include cell

proliferative, autoimmune/inflammatory, neurological and gastrointestinal
disorders. The MEMAP polynucleotides and proteins are also used for the

ciagnosis of these disorders. Specific examples of these disorders
include cancer, inflammation, atherosclerosis, epilepsy and diarrhoea.

MEMAP proteins can be used to screen for compounds which specifically
molecules. MEMAP polynucleotides can be used to prepare transgenic
animals which can be studied to provide information concerning human
disease. Anti-MEMAP antibodies are useful in immunoassays for the
detection of MEMAP protein and can be used as antagonists to treat or
prevent a disorder associated with MEMAP. Polynucleotides encoding MEMAP
can be delivered to target cells with genetic abnormalities with respect
to the expression of MEMAP to treat or prevent a disorder associated with
MEMAP

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, to stimulating the release of tumour necrosis factor-alpha from human blood, cor stimulating or inhibiting the proliferation of normal human blood, the proliferation and for tissue typing. The PRO nucleic acids have weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        VQVTIDPAPVTQEETSSSPTLTGHHLDNRHKLLKLSVLLPLIFTIXLLLLVAASLLAWRM 180

The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polyucleotides are useful for preparing a medicament useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABU80739-ABU80860 from represent the human PRO Polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, PRO polypeptide, secreted and transmembrane protein, anti-PRO antibody, diagnostic assay, gene expression, tumour, cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gerritsen ME, Goddard A, Godowski PJ;

The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypepitides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polynucleotides are useful any paramaceuticals, diagnostics, blosensors or bloreactors. These are particularly useful for detecting tumour, rectal tumour, colon tumour, breast tumour, prestate tumour, rectal tumour, or liver tumour) in a mammal, for stimulating the proliferation or differentiation of chondrocyte for stimulating proliferation of periopyer cells, or for modulating normal human dermal fibroblast proliferation. The PRO nucleic acid or polypeptide is also useful for treating tumours or various bone and/or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New genes, and its encoded secreted and transmembrane polypeptides, useful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or pericyte proliferation, especially for treating lung tumors, arthritis or wounds in a mammal.

PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                       encoding nover human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, enclothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertronsion, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophiebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular blotogy, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MPLITLYLLIFWLSGYSIATQITGPTTVNGLERGSLTVQCVYRSGWETYLKWWCRGAIWR

The invention relates to a novel isolated mucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulation or gene expression in pericyte cells or the release of TMF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dernal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO protein of the invention
                                                                                                                                                                                                   New nucleic acid encoding for a PRO protein, useful for the manufacture of a medicament for diagnosing or treating tumors or for measuring or detecting expression of an associated gene.

ಥ ö New PRO protein encoding nucleic acid, useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence tumor in a mammal.

Claim 11; Fig 40; 324pp; English

The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a utwour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention

```
The invention relates to an isolated nucleic acid encoding a PRO polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate full length PRO cDNA. The PRO polypeptides are useful for chondrocyte stimulation, TMF-alpha stimulation, human dermal fibrobiasts stimulation and for detecting the presence of tumour in an mammal. The PRO polypeptides are useful as molecular markers for protein electrophoresis and the isolated nucleic acids may be used for recombinantly expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO and in affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents the amino acid sequence of a human secreted/transmembrane 'PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DCKILVKTSGSEQEVKRDRVSIKDNOKNRTFTVTMEDLMKTDADTYWCGIEKIGNDLGVT 120

pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The mucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is the amino acid sequence of a human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information received from other cells and the immediate environment. The information is often transmitted by secreted factors, differentiation factors, neuropeptides and horamones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gerritsen ME, Goddard A, Godowski PJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes an isolated PRO (secreted and transmembrane) polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO351, PRO357, PRO1155, PRO11306 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF)-

Gerritsen ME, Goddard A, Godowski PJ; Smith V, Stephan JF, Watanabe CK, Wood WI; as One hundred and twenty two nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, or hybridization probes in chromosome and gene mapping. Claim 11; Fig 40; 305pp; English. transmembrane PRO polypeptide 01-JUN-2001, 2001WO-US017800. 29-JUN-2001, 2001WO-US021066. 09-APR-2002, 2002US-00119480. 13-AUG-2002; 2002US-00219481 Desnoyers L, (GETH) GENENTECH INC. WPI; 2003-657982/62. N-PSDB; ADB80635.

The invention describes an isolated PRO (secreted and transmembrane)
CC polypeptide (1): PRO992: PRO1167 or PRO1329 polypeptide are
useful for stimulating the proliferation of or gene expression in
Derivate cells: PRO357, PRO257, PRO1272 or PRO4405 polypeptide are
to stimulating the proliferation of differantiation of chondrocyte
cells: PRO317, PRO357, PRO125, PRO1306 or PRO1419 polypeptide
cells: PRO317, PRO357, PRO725, PRO1106, PRO1419, PRO214,
PRO477, PRO317, PRO357, PRO515, PRO1806, PRO1419, PRO1419, PRO214,
CC are useful for stimulating the release of tumour necrosis factor (TMF)cells: PRO3137, PRO526, PRO516, PRO1083, PRO1419, PRO1106,
CC PRO477, PRO3137, PRO526, PRO1085, PRO1921, PRO1106, PRO141, PRO1106,
CC PRO1026, PRO1181, PRO1126, PRO1106, PRO1192, PRO11244, PRO1112,
CC PRO1026, PRO1301, PRO1181, PRO1106, PRO1192, PRO1244, PRO1112,
CC PRO1026, PRO1301, PRO1181, PRO1181, PRO1181, PRO1301, PRO1181, PRO1301, PRO1181, PRO1301, PRO1181, PRO1181, PRO1181, PRO1181, PRO1181, PRO1181, PRO1181, PRO1181, PRO188, PRO1181, PRO1181, PRO188, PRO1181, PRO188, PRO1181, PRO1298, PRO188, PRO1181, PRO1898, PRO1898, PRO1898, PRO1898, PRO1891, PRO1898, PRO1898, PRO1898, PRO1898, PRO1898, PRO1898, PRO1899, PR

61 DCKILVKTSGSEQEVKRDRVSIKDNQKNRTFTVTWEDLMKTDADTYWCGIEKTGNDLGVT 120 The invention describes an isolated PRO (secreted and transmembrane) polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the prol160 or of or gene expression in periorre cells. PRO357, PRO229, PRO1270 or PRO4405 polypeptide are useful for stimulating the prol1feration or differentiation of chondrocyte are useful for stimulating the release of tumour necrosis factor (TMF) - alpha from human blood. PRO982, PRO357, PRO1306, PRO1306, PRO1419, PRO214, human; secreted and transmembrane protein; PRO; cytostatic; vulnerary; antiarthritic; pericyte cell proliferation; pericyte cell proliferation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; (TNF)-alpha release; dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; gene mapping; gene therapy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bloreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, postate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of normal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New PRO polypeptides and nucleic acids encoding the polypeptides, useful e.g. in gene therapy, disease diagnosis, chromosome identification and

antisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

WPI; 2003-765494/72. N-PSDB; ADB78012.

Novel isolated PRO polypeptide useful for tissue typing, gene therapy, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.

Claim 11; Fig 40; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

CD Olygeptide (I) PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the prol16feration of or gene expression in periove cells. PRO357, PRO125, PRO1187 or PRO41329 polypeptide are useful for stimulating the prol16feration of of chordrocyte cells. PRO357, PRO725, PRO1306 or PRO419 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF) alpha from human blood. PRO937, PRO1306, PRO1306, PRO1306, PRO1306, PRO1307, PRO1307, PRO1306, PRO1307, PRO1307, PRO1307, PRO1306, PRO1307, transmembrane PRO polypeptide

Banting G., Brake B., Braghetta P., Luzio J.P., Stanley K.K.;

"Intracellular targetting signals of polymeric immunoglobulin
receptors are highly conserved between species.";

FEBS Lett. 254:177-183(1989).

-!- PUNCTION: THIS RECEPTOR BINDS POLYMERIC IGA AND IGM AT THE
BASOLATERAL SURPACE OF EPITHELIAL CELLS. THE COMPLEX IS THEN
TRANSPORTED ACROSS THE CELL TO BE SECRETED AT THE APICAL SURFACE.

DURING THIS PROCESS A CLEAVAGE OCCURS THAT SEPARATE THE
BYRAACELLULAR (KNOWN AS THE SECRETORY COMPONENT) FROM THE
TRANSFERBRANE SEGMENT.

-!- SUBCELLULAR LOCATION: Type I membrane protein. Also secreted.

-!- SIMILARITY: Contains 5 immunoglobulin-like V-type domains.
                                                                                                                                                                                                        Eukaryota; Merazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

ISOIG-P81265-2; Sequence=VSP 002547;
TISSUE SPECIFICITY: FOUND IN MAMMARY GLAND, JEJUNUM, LUNG, KIDNEY AND SMALL INTESTINE.
PYM: IN THE ABSENCE OF DIMERIC IGA, SER-727 IS PHOSPHORYLATED WHICH ALLOWS PIGR TO FUNCTION NORMALLY.
SIMILARITY: Contains 5 immunoglobulin-like V-type domains.
                                                                                                                                             receptor-encoding CDVA.";
Gene 164:229-333 (1995).
-!- PUNCTION: THIS RECEPTOR BINDS POLYMERIC IGA AND IGM AT THE
BASOLATERAL SURPACE OF EPITHBLIAL CELLS. THE COMPLEX IS THEN
TRANSPORTED ACROSS THE CELL TO BE SECRETED AT THE APICAL SURFACE.
DURING THIS PROCESS A CLEAVAGE OCCURS THAT SEPARATE THE
EXTRACELLULAR (KNOWN AS THE SECRETORY COMPONENT) FROM THE
TRANSMEMBRANE SEGMENT.
                                                                                         SEQUENCE FROM N.A.

Note=Alternative use of an acceptor site. No experimental confirmation available;
TISSUE SPECIFOTTY: Expressed on monocytes and B-cells, and at lower levels on dendritic cells. Detected at low levels in natural killer (NK) cells.
DOMAIN: Contains 3 copies of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM).
This motif is involved in downmodulation of cellular responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE=22758998; PubMed=12853576;

BECOKE G.P., Parsons K.R., Howard C.J.;

"Cloning of two members of the SIRP alpha family of protein tyrosine prosphates binding proteins in cattle that are expressed on monocytes and a subpopulation of dendritic cells and which mediate binding to Toba T cells.";

Eur. J. Immunol. 28:1-11(1998).

"I bur. J. Immunol. 28:1-11(1998).

"I bur. J. Immunol. 28:1-11(1998).

"I controlly: Immunoglobulin-like cell surface receptor for CD47. Acts as docking protein and induces translocation of PTPN6, prepared membrane. Supports adhesion of cerebellar neurons, neurite plasma membrane. Supports adhesion of cerebellar neurons, neurite outgrowth and glial cell attachment. May play a key role in intracellular signaling during synaptogenesis and in synaptic function. Involved in the negative regulation of function growth factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cells and inhibits cytokine production by mature dendritic cells and inhibits cytokine production by mature dendritic cells and inhibits cytokine production by mature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. Binds GRB2 in vitromarcophages, where it primarily binds PTPN6. Binds GRB2 in vitrosited JAK2 irrespective of its phosphorylation status and forms a stable complex. Binds SCAPI and/or SCAP2. The resulting complex recruits FYB. Binds FGR and PTK2B (By similarity). SUBCELLOARING, Type I membrane protein.

IISSUS SPECTICITY: Highly expressed in spleen macrophages. Detected in skin dendritic cells.
                                                                                                                                                                                                                                                                                                                                                       04661, 046632;
